Some measures of portfolio analysis based on entropy mean-variance frontier are studied. Risk aversion index and Pareto-optimal sharing of risk are explained. In view of these facts it is very interesting to study how the investor should make investments so that his total expected return is maximized and the risk of losing his capital is minimized. A maximum entropy model in risk sharing is proposed and applied to some problems. 29 Bond-Market Indexes Global Government Bond Indexes Global bond market dominated by government issues Several indexes created by major investment firms Measure total rates of return Use market-value weighting Use trader pricing But sample sizes and numbers of countries differ Differences affect long-term risk-return performance Low correlation among several countries Significant exchange rate effect on volatility and correlations. 32 Composite Stock-Bond Indexes Brinson Partners Global Security Market Index (GSMI) Includes: U.S. stocks and bonds Non-U.S. equities Non-dollar bonds Allocation to cash Matches a typical U.S. pension fund allocation policy Close to the theoretical “market portfolio of risky assets” referred to in the CAPM literature.
